Question (a) – Brief Introduction of Nike Training Club

Nike Training Club (NTC) is a free fitness app developed by Nike which provides a wide range of guided workout plans, training programs, and fitness resources to users. The main purpose of this app is to help users improve their overall health levels, wellbeing levels, and lead to a healthier lifestyle. This app is perfectly suitable for those who are fitness fanatics, regardless of whether they have fitness basic or not.

Question (b) – Features of Nike Training Club

Specific feature 1: Free Workout Videos

One of the specific features on Nike Training Club app is the free workout videos that users can filter out based on their preference. The target behaviour is to make the user click into the workout videos to work out. The Fogg Behaviour model asserts that for a target behaviour to happen, a person must have sufficient motivation, sufficient ability and an effective trigger.

By referring to the Fogg Behaviour model, the ability of this feature is high because it includes the elements of simplicity, which are time, money and physical effort. As outlined in the reference paper, time is the first element of simplicity. Users can use the filter button to choose short workout videos so they can workout even if they have a busy life. Moreover, the next element of simplicity is money. The workout videos available in this app are free of charge. This accessibility ensures anyone who has the motivation to workout can access to all videos in this app. Furthermore, based on the reference paper, behaviours that require physical effort may not be simple, which reduces the level of ability. Users can use the filter button to find workout videos that do not require equipment to workout. By eliminating the necessity to commute to a gym, users can minimize their physical effort, enhancing the likelihood of consistent engagement with the app's workout routines.

In terms of motivation, users have high motivation to watch workout videos to workout because they can obtain social acceptance. In today's society, unrealistic body standards are pervasive and often perpetuated by media, advertising, and social media platforms. These standards typically emphasize thinness, muscularity, and specific physical features, creating an idealized image of beauty that is often unattainable for the majority of individuals. People frequently compare themselves to the unrealistic standards portrayed in media and social media,

leading to unhealthy workout routine. However, in this app, the videos available are professionally made and there are also healthy balanced diet suggestions for users. Therefore, this encourages users to watch workout videos daily to exercise, not only for physical health but also as a means to cultivate a positive body image and achieve social acceptance.

In addition, users will also be motivated by fear when they become aware of their declining health. When people start to age, our body's metabolism naturally slows down and some people may start to experience minor health problem such as joint pain, insomnia and decreased stamina. As a result of the fear that their health problem may get worse in the future, they will start motivating themselves to workout frequently to overcome health problems.

Regarding the trigger aspect, the filter button feature is considered the second trigger type which is facilitator. The facilitator is used to trigger the user to watch videos based on their proficiency level, whether they are beginner, intermediate or advanced, making the target behaviour easier to do. For beginners, they can select beginner level under the filter button, which can help initiate workouts that align with their skill level, preventing any feelings of overwhelm or frustration from more advanced routines. The filter button is also positioned at the bottom right corner, where it is easily detected by users and easily accessible with just a single click.

Specific feature 2: Free Tips on Movement, Nutrition, Rest, and Mindfulness

The second feature of the NTC app is offering free tips about movement, nutrition, rest, and mindfulness. The target behaviour of offering these kinds of fitness articles is to encourage the users to explore alternative approaches to improve their overall health and well-being instead of training alone. Based on FBM, NTC also leverage the three main factor which are motivation, ability and trigger into this feature.

In motivation aspect, NTC utilise two motivators which are hope/fear and social acceptance/rejection. In term of hope/fear, the users will be motivated by the hope of achieving their fitness goals by the knowledge and guidance in the tips. For example, the tips on nutrition offer a wide range of recipes of healthy meals to instil the hope for better diet habit. Moreover, the tips of rest and mindfulness will help users to relax and reduce stress in order to improve their mental health and well-being. For social acceptance/rejection, the tips provide many information and advices which align with the prevailing fitness and wellness trends which are

able to improve the user's social acceptance. As the result, the users will be more motivated to engage in the tips to stay connected with the social circle or fitness community. In addition, by engaging in the tips, the users will be more confident and energetic, this will reduce the fear of being socially rejected or left behind in their fitness community.

On the other hand, optimizing ability is important to make sure the users can easily access and engage in the tips. Based on FPM, this NTC app focus on three elements of simplicity, which are time, physical effort and brain cycles. In term of time and physical effort, NTC provide a clear and intuitional interface to make sure the users can quickly browse and read the tips. The users can easily access the relevant tips without spending too much time in searching the tips from browsers. What's more, unlike other software, this app does not have various ads embedded in it, hence the users do not need to manually close it or wait for the ads to end, this not only save the user's precious time but also their energy. For brain cycles aspect, the NTC designed the content arrangement with the purpose to minimize the user's cognitive load to make the tips easy to understand and digest. For example, for nutrition tips, the users able to see various of attractive healthy meals and desserts. After they click the pictures, the users will see the brief intro of the meals, an ingredient list, a clear instruction and the nutrition information per serving of the meal. Every steps are easy and straightforward which will help the users easily learn something without feeling overwhelmed or mentally tired.

Last but not least, trigger is important for the users to initiate engaging in NTC content. For this free tip feature, NTC highlights two types of triggers, which are spark and facilitator. For spark, the title of each tips serve as a powerful spart to capture user's attention. For example, a tip titled "Why You Don't Want "Extra" Sleep" sparks curiosity of users and highlights the benefits of having enough rest. Furthermore, the attractive picture of the recipes also serve as a spark. The vibrant pictures show that even though that is a healthy meal but it can also be delicious, this will help to attract the user attention and stimulate their appetite for healthy eating. In order to help those users who are lack of ability to execute the workout session, NTC prepares various of movement, rest and mindfulness tips which can be served as facilitator. These tips simplify the process to have healthy fitness and well-being level, which verify the meaning of facilitator – make the behaviour easier.

Question (c) – Demonstration Video

- https://drive.google.com/drive/folders/1iGkDGutMsiXNIUW_Ap1FDIFaNoVrQx8N

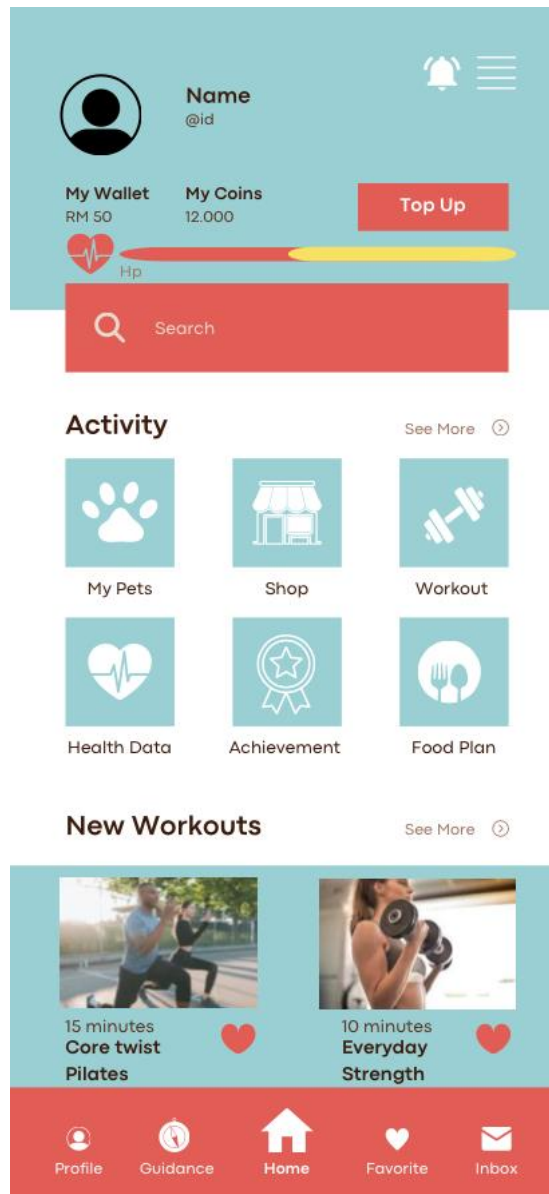

Question (d) – The feature of the Nike Training Club that fail to persuade a user to execute the target behaviour:

According to FBM, in the aspect of motivation, the Nike Training Club application is lack of attractive rewards and sufficient incentives, but these elements are essential for driving user pleasure and motivation. Users are more likely to stay committed to their fitness routines when they feel rewarded for their efforts. However, the rewards or benefits associated with using the dull achievement feature may not be appealing enough to motivate users to take action. The current rewards system within the app may need to be redesigned to better align with user preferences and expectations. In order to boost the levels of motivation, we can look at how pleasure and pain can be embodied.

To address these issues, Nike Training Club app can incorporate gamification elements such as challenges, rewards, and progress tracking to enhance motivation. Gamification elements can significantly enhance user engagement and motivation within the Nike Training Club application. The gamification features can be including earning health points (HP), digital coins and digital pet rewards.

1. Health Points (HP)

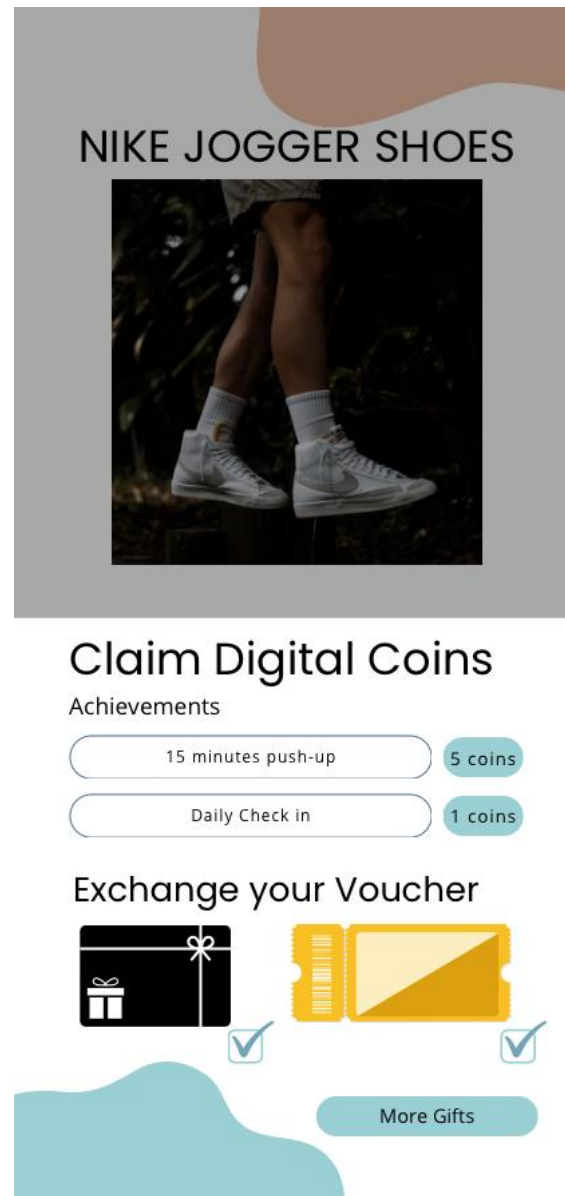

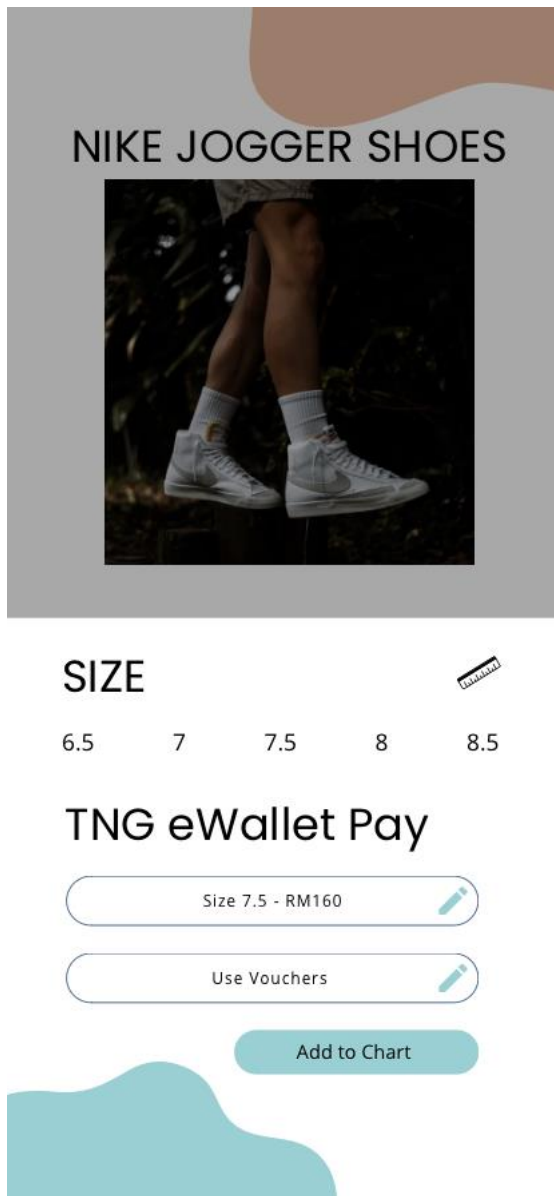

HP can be maintained by completing workouts, reaching milestones, or consistently exercising over time. Users also can set fitness goals and earn extra HP as they progress towards achieving them. To achieve the feelings of pleasure, HP can be used to unlock new features, levels, or challenges within the app. However, if a user fails to complete scheduled workouts or neglects their exercise routine, their HP can gradually decrease. This penalty for inactivity encourages users to stay consistent with their workouts and maintain a healthy lifestyle.

2. Digital Coins

Users can earn digital coins by participating in workouts, completing challenges, or achieving personal bests. These coins can be used to purchase virtual goods such as workout attire, equipment upgrades, or premium features.

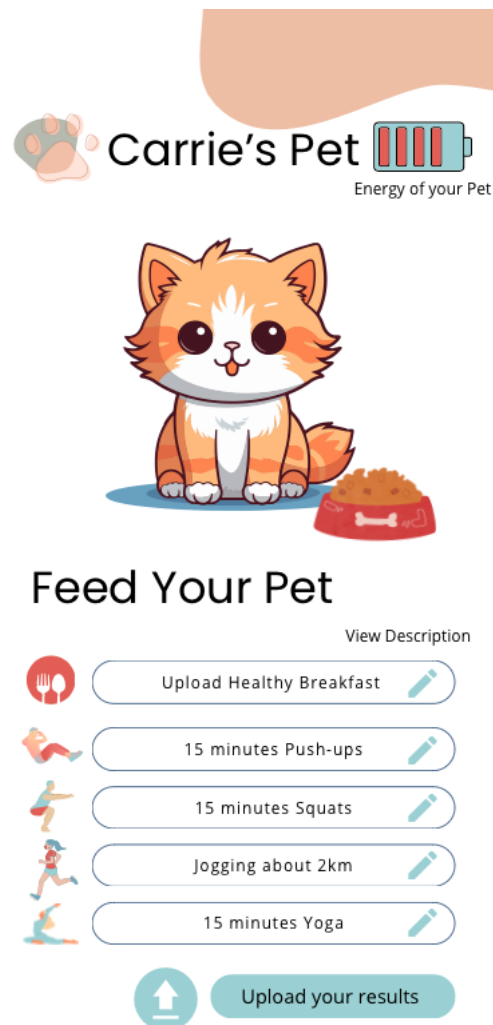

Moreover, the digital coins earned can be used to exchange Nike voucher or gift cards to purchase Nike's products, by giving special offers or discounts on Nike's products to incentivise continued engagement.

3. Digital Pet Rewards

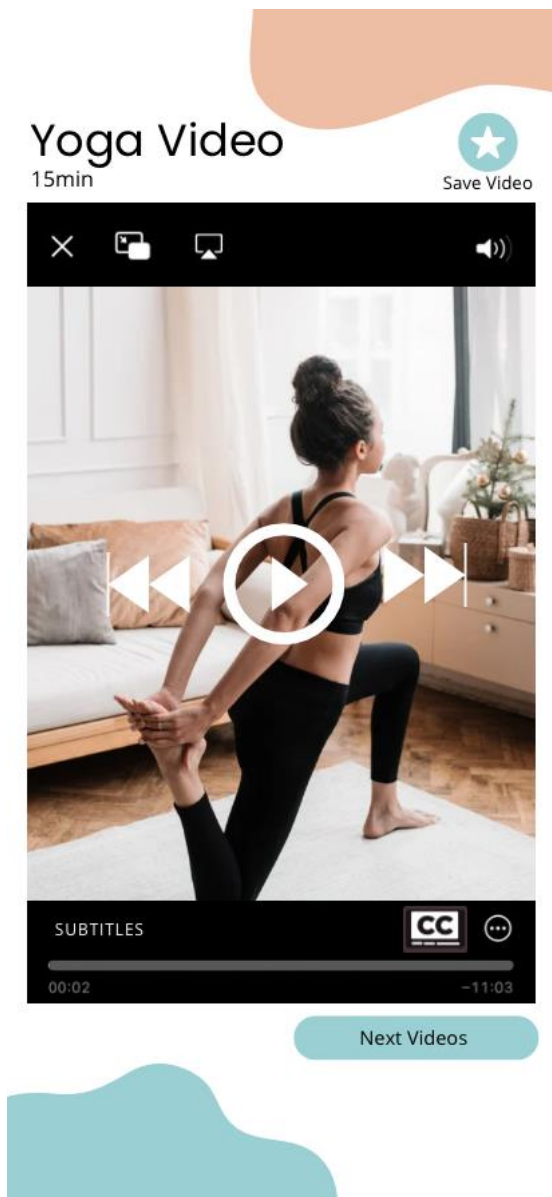

Nike Training Club application can introduce a virtual pet feature where users can adopt and nurture digital pets. For example, users can feed their digital pet by participating in workouts or completing daily tasks to encourage regular engagement with the app. Users also can earn rewards or digital coins based on their pet's progress and achievements. Importantly, the pets can provide motivational messages, tips, or reminders to keep users motivated and accountable.

Nike Training Club application can offer virtual pets for completing specific workouts, challenges, or levelling up. For example, users can collect and showcase their virtual pets' collection within the app, providing a sense of accomplishment and status.

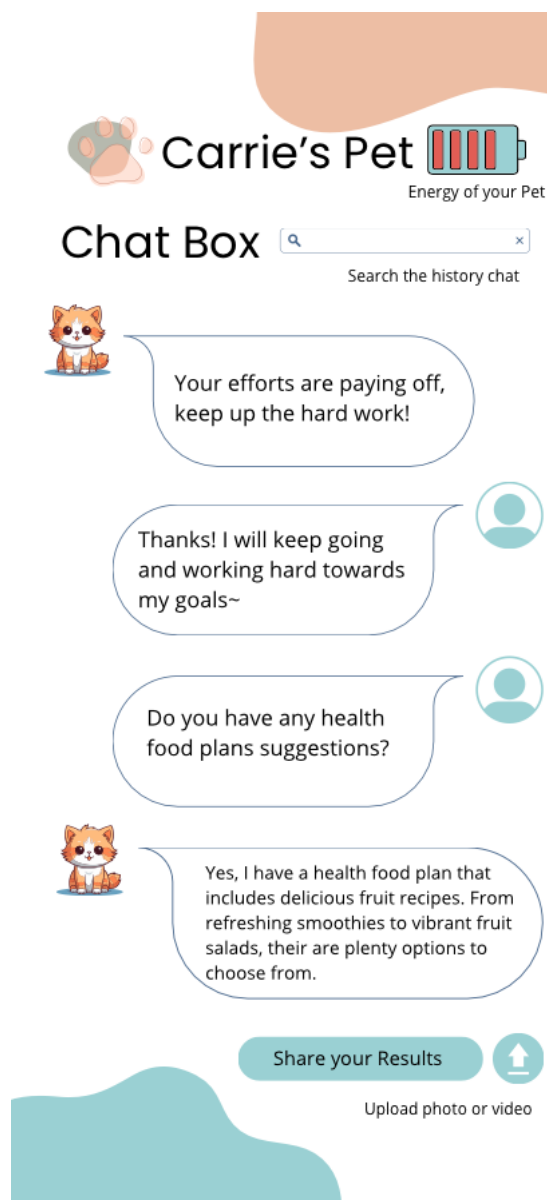

According to FBM, in the aspect of ability, Nike Training Club application may be difficult to use by deaf individuals, where most of the instruction workout videos are not subtitled. Without subtitles, deaf individuals are unable to understand verbal instructions provided in the workout videos. This makes it challenging for them to follow along with the exercises accurately and safely. Without subtitles, they may feel excluded and disconnected from the content, leading to a sense of dissimilation and frustration.

To address this issue, it is essential for the app developers to prioritise accessibility and implement subtitles or alternative forms of instruction that cater to the needs of deaf users. By doing so, they can ensure that the feature is inclusive and welcoming to all users, regardless of their hearing abilities.

According to FBM, in the aspect of triggers, the Nike Training Club application is lack of sparking reminders. Users may forget to use the application if there are no timely reminders to encourage them.

To solve this issue, users could have the option to adopt a virtual pet within the app. They could choose from different types of pets such as dogs, cats, or even mythical creatures. The virtual pet could serve as a reminder system for users' fitness activities. For example, users could set up personalised reminders for workouts, hydration, or rest periods, and these reminders would be delivered through notifications from their virtual pet.

The Nike Training Club application is also lack of signal. The feature is not be presented in the right context or at the right time, thus reducing its effectiveness in prompting action.

To address these challenges, integrating Bluetooth connectivity with a weighing scale into the Nike Training Club app to monitor users' body condition and track various health metrics such as body mass index (BMI), body weight, water content, muscle mass, fat percentage, and heart rate variability (HRV). This feature can track their progress over time through interactive graphs and charts. Based on the recorded health metrics, the app could provide signal and recommendations to help users achieve their fitness goals. For example, if a user's BMI is outside the healthy range, the app could suggest dietary changes or recommend specific workouts to improve their overall health.
