

Question

1. What types of devices (routers, switches, access points, etc.) are preferred or required for compatibility with the existing university network?
2. What level of redundancy or backup is expected for network reliability in each area?
3. How should we address scalability in the network design to accommodate future growth in student and staff numbers?
4. What is the expected internet speed and bandwidth capacity needed to support high-speed connections in each area?
5. Are there budget constraints for specific areas or device categories that should guide our equipment selection?
6. What is the preferred IP addressing scheme, and should we allocate static or dynamic IPs for different areas?
7. Are there specific cabling requirements (e.g., Cat6, Cat6a, or fiber optic) for each area to support future bandwidth needs?
8. Should we implement network segmentation (e.g., VLANs) to isolate traffic between different areas like labs, classrooms, and the student lounge?
9. What security protocols are required to protect sensitive information and prevent unauthorized access within the network?
10. Are there any specific outdoor areas or high-density zones (e.g., student lounge) that need extended Wi-Fi coverage?
