1.0 Tutorial Followed

The tutorial I followed is “Basic Trial - SAP Build Apps”, where I found it at the SAP Learning Journeys Website. This tutorial is to create a Sales Order App using SAP Build Apps that allows users to create new sales orders and view existing sales. The tutorial includes designing a user interface, integrating it with SAP S/4HANA backend system and deploying the application on SAP BTP.

2.0 What I Explored

From this tutorial, I explored the multiple features of the SAP Build Apps. I learned to manually design the UI for an app, and using the Generative AI features to automatically generate pages based on data. I also explored how to connect this application with SAP/4HANA using OData services which is the API. Finally, I explored the deployment lifecycle, where I packaged an app and hosted it on the Cloud Foundry environment.

3.0 Steps I Tried

First, I manually build a "Create Sales Order" form, like creating the containers and creating input fields for Customer, Material, and Quantity and Delivery Date. Then I connected this form to the S/4HANA backend using the S4HANA_ODATA_Products service. Moreover, I created a dropdown list for Material and wrote a specific MAP formula for it. I also created a "Get Approval" button to trigger a process automation workflow.

Furthermore, I used the Generative AI function to create a "Viewer" page. It automatically created a list page and a detail page for the Sales Order Viewer App using the data from SAP/4HANA.

Lastly, I published and deployed the application to Cloud Foundry. First, I configured the build setting for the application. Then, I authenticated the Cloud Foundry API and deployed the app on SAP BTP. The link is:

4.0 What I Learned

From this tutorial, I learned how to use the SAP Build Apps tool to create a simple and functional application. I got hands-on experience in manually designing a user interface, connecting it to backend data sources which is SAP S/4HANA and configuring the necessary logic. Furthermore, I learned the deployment process like I need to configure the build setting before publishing the app to the SAP BTP, to enable it to be accessed in a live web application.
